

Urocentrum turbo

DIVE INTO THE BEATY POND

FUN FACT

This protist is harmless...but some can eat your brains!!!

Eukaryote and Single Cell?

A eukaryote is an organism that has an organelle like the nucleus. Humans and protists are examples of eukaryotes. A single-celled organism is made up of just one cell!

What is a Protist?

Protists are eukaryotic organisms but are not animal, plant or fungi. Most are single-celled.

How small am I?

This protist is too small to see with the naked eye! A microscope with a magnification of 400X was used to generate this image. It is 70 micrometers long and 44 micrometers wide, about the same as the thickness of your hair!

Color Me!

TAIL

Come get to know me

Habitat

I live in freshwater environments like ponds, rivers, and lakes.

Appearance

I have cilia that cover my entire surface, and my tail is made up of fused long cilia. I look like a snowman that has two snowballs.

Movement

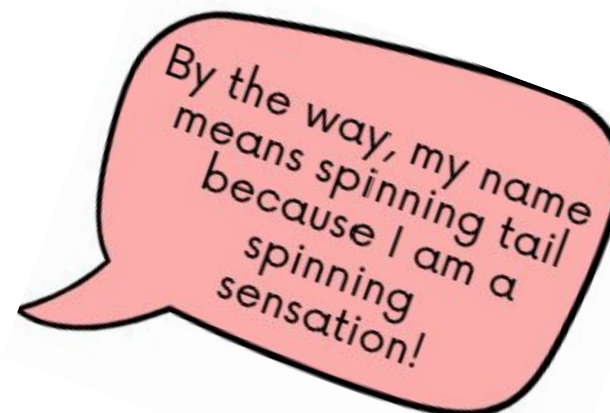

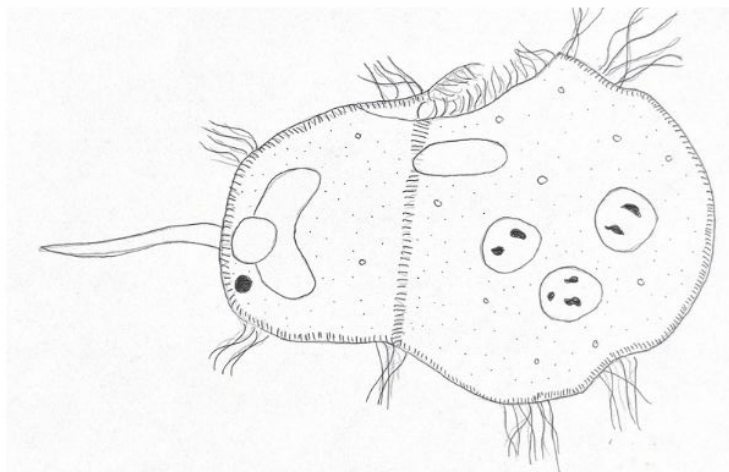

I beat my cilia quickly to move, and my tail is there for anchoring onto things. Under the microscope, you can see me quickly spinning around!

Feeding

I generate a current by moving around while my tail is attached to something. Bacteria get trapped in the cytostome, and then food vacuoles digest them.

Job

I graze on bacteria, which helps keep the freshwater environment clean!

MIROSCOPY FACTS

Scale bars are used in microscopy to image how small the organism is in real life. We use scale bars all the time for example maps.

We know on a map that a house is 1 cm away from another house but in real life it is about 5 meters away. The scale here would be 1:500, for every 1 cm we see on the map, it represents 500 cm (5 meters) in real life!
